

CSC4026Z Chat Server Documentation

User Interface

Chat applications can have all sorts of interfaces. Your team will decide whether to implement as a CLI tool, a desktop app, a mobile app, a website, or even as a backend to another chat application.

Regardless of the mechanism, your User Interface should support the following functions:

- Connecting to the chat server
- Maintaining an ongoing session without User action
- Setting the User's username
- Sending DMs to other Users
- Displaying a list available Channels
- Displaying a list of connected Users
- Displaying information about a Channel (it's description and list of members)
- Displaying information about a User
- Creating a new Channel
- Joining an existing Channel
- Sending and receiving messages on a Channel
- Leaving a Channel
